Anatole Palmer Seychal

Berkeley, CA | (415) 713-8937 | aseychal@berkeley.edu | linkedin.com/in/anatole-seychal | anuhtole.github.io/

Education

University of California, Berkeley Expected Graduation: 2027
B.A. Applied Mathematics (AI/ML Track), B.A. Data Science, B.A. Political Economy

Relevant Coursework: Machine Learning, Abstract Linear Algebra, Complex Analysis, Numerical Analysis, Real Analysis, Data Mining & Analytics, Data Structures, Physics for Scientists & Engineers, Discrete Mathematics, Multivariable Calculus

Professional Experience

Microsoft **Redmond, WA**
Product Manager Intern – Copilot Studio (0 → 1 Contact Center AI Initiative) *June 2026 – Present*
- Built end-to-end closed-loop optimization engine for Copilot Studio contact-center voice agents, converting conversations into evidence-backed knowledge, tool, routing, and configuration improvements, now in private preview testing with F500 customers
- Designed the 6-layer data & processing architecture with an eight-stage idempotent analysis pipeline and authored a 17-section build-ready system specification for the engine, receiving endorsement from engineering team, data science team, & VP of product
- Designed an 8-layer evaluation framework spanning groundedness, cluster quality, pre-deployment quality scoring, case regression, expert labeling, and post-deployment outcome measurement, gating every change behind maker approval and staged rollout
- Built a deterministic seeded synthetic-data pipeline generating 300+ labeled human-agent interactions across 5 failure modes plus 15 healthy regression controls, driving failure taxonomy, prompt optimization, regression testing, and cross-model evaluation
- Built ContextPilot, a recoverability-aware context optimizer for long-running AI agents using ski-rental token economics; backtests across 10,000 simulated sessions project ~50% token-cost reduction, validated with 0 unsafe releases on 500+ live shadow sessions

Microsoft **Redmond, WA**
Product Manager Intern – Power Apps *June 2025 – August 2025*
- Architected Multi-Agent Orchestration system, enabling click-to-fix reconciliation, scenario simulation, and multi-user editing
- Conceived, developed, and owned AI Reviewer Agent feature that analyzes Power App plan changes, surfaces fundamental logic inconsistencies, detects cascading impacts, and provides actionable feedback to app makers, increasing output efficiency by 35%
- Built both systems end-to-end, spearheading engineering process, determining logical triggers, and fine tuning LLM logic pipeline
- Led cross-functional team through strategic rollout planning, testing with 100+ stakeholders, LLM-powered feedback refinement, improving overall maker edit satisfaction by 40%, increasing plan edit rate by 22%, and decreasing plan abandonment rate by 15%
- Presented experience review of Orchestrator & Reviewer future expansion to C-suite & product VPs, receiving executive buy-in

Dialpad **San Ramon, CA**
Product Management Intern *June 2024 – August 2024*
- Integrated fine-tuned LLM to streamline legacy IVR voiceover & voice direction systems, cutting $50,000+ in yearly contract costs
- Revised 30+ AI features in contact & sales centers, email automation, mobile app, video conferences, settings menu, & UI/UX
- Drove product expansion in 10+ languages for 50+ countries, leading French and Spanish expansion, transcription, & integration

Research & Project Experience

Spine – Agent Security & Compliance Layer – 10+ Companies (Beta), YC top 3% – GitHub *April 2026 – Present*
- Co-authored NeurIPS 2026 workshop paper: plan-bound monitor blocked 30/30 prompt-injected DNA orders; rules let 22 pass
- Co-designed default-deny tool-call gate (p99 < 50 ms), hash-chained audit log & a plan reviewer that untrusted data never reaches
- Ran pre-registered AgentDojo study (1,312 attacks, 22 agent LLMs): isolated monitor matched full-context ASR at 21x lower cost
- Wrote the threat model & a 165-case prompt-injection corpus red-teaming the reviewer in CI, making isolation a tested invariant

CostShield – Cost-Aware AI Agent Traffic Control – GitHub *June 2026 – July 2026*
- Built a reverse proxy defending LLM endpoints from denial-of-wallet attacks by metering agents on dollar cost, not request count
- Shipped 5-stage pipeline: rDNS/CIDR attribution, predicted-cost admission, EWMA cost reconciliation, live per-operator blocks

University of California, Santa Cruz **Santa Cruz, CA**
Quantum Mechanics Researcher – Velasco Lab *July 2022 – August 2022*
- Conducted condensed matter physics research under Prof. Jairo Velasco investigating the quantum Hall effect in graphene
- Performed hands-on experimentation with carbon nanotubes & other quantum systems via scanning tunneling microscopy (STM)
- Gave 3 presentations to UCSC graduate students on graphene monolayers for superconductivity, winning Best Presentation

Skills & Interests

AI/ML: Anthropic & OpenAI APIs, agent orchestration, evals/benchmarks, synthetic data, RAG, harness engineering, TensorFlow, Claude Code, Codex, MCP **| Engineering & Data:** Python, TypeScript, SQL, Java, Next.js, C++, Prisma, React, Pandas, NumPy, AWS, Azure, Databricks, Git, Linux **| Languages & Tools:** French (fluent), Spanish (advanced), Figma, Jira, Power BI, Salesforce

Activities & Societies: Berkeley Business Society, Entrepreneurs@Berkeley, YC Startup School 2026, Intramural Soccer & Basketball
